	Paper Title:	Prototype Model of Multi-Load AGV for Material Supply in Manufacturing System	
	<p><b>Abstract:</b> Here we aim to build a model of the multi load material supply system which is the hybrid of AGV (Automated guided vehicle) and AS/RS (Automated storage/Retrieval system) system. The AGV base provides movement in the manufacturing facility and AS/RS provides storage of the material. The machine can be designed depending on the AGV load caring capacity and variety of material need to be carried. Depending upon number of variety of products and requirements, compartment can be increased or decreased. One of major advantage of this kind of machine in normal AGV is it has high throughput. Since single machine can carry more products hence number of AGVs needed to handle material is less thereby traffic in the manufacturing environment can be decreased and more efficiency in material handling transportation can be achieved. Due to decrease in AGV numbers in manufacturing environment, cost of handling and maintenance them is reduced hence it saves money and increase efficiency.</p> <p><b>Keywords:</b> Multi-load Robots, Multi Load AGVs, Revolutionary AGV Design.</p> <p><b>References:</b></p> <ol style="list-style-type: none"><li>1. 	Paper Title:	OCR Based Mapless Navigation Method of Robot	
	<p><b>Abstract:</b> This paper reviews a method for a robot can locate and track landmarks using segmentation algorithm within proper distance, It extracts text or sign from the landmark and inputs them into the OCR engine for recognition. Simultaneously, a projection analysis of texts or signs of the landmark is conducted, finally by identifying the semanteme of text or signs the robot can find the routes to the destinations automatically. Experiments on the robot model shows that this method can be used to accomplish mapless navigation task perfectly in the indoors or customised environment. Being able to navigate with landmarks in real life directly without generating maps or resetting new navigation sign for robots. Specially, this method can be applied in the field of service robots rapidly, which can enhance their adaptability and viability significantly.</p> <p><b>Keywords:</b> Mapless navigation, Landmark recognition, OCR, Kohonen Neural Network.</p> <p><b>References:</b></p> <ol style="list-style-type: none"><li>1. 	Paper Title:	Implementation of UART with BIST Technique in FPGA	
	<p><b>Abstract:</b> Asynchronous serial communication is usually implemented by Universal Asynchronous Receiver Transmitter (UART), mostly used for short distance, low speed, low cost data exchange between processor and peripherals. UART allows full duplex serial communication link, and is used in data communication and control</p>		

3.	<p>system. There is a need for realizing the UART function in a single or a very few chips. Further, design systems without full testability are open to the increased possibility of product failures and missed market opportunities. Also, there is a need to ensure the data transfer is error proof. This paper targets the introduction of Built-in self test (BIST) and Status register to UART, to overcome the above two constraints of testability and data integrity. The 8-bit UART with status register and BIST module is coded in Verilog HDL and synthesized and simulated using Xilinx XST and ISim version 14.4 and realized on FPGA. The results indicate that this model eliminates the need for higher end, expensive testers and thereby it can reduce the development time and cost.</p> <p><b>Keywords:</b> UART, BIST, Error check, Status register, LFSR.</p> <p><b>References:</b></p> <ol style="list-style-type: none"> <li>1.
